## Ch. 1 Problem Set 1

1. Estimate the magnitude in kg of $\mathrm{a}:$ mouse, car, house, battleship.
2. A cubit was based on the size of a palm. If the ark was supposedly 300 cubits by 50 cubits by 30 cubits, estimate the volume in cubic meters. How does this compare to an average $2000 \mathrm{ft}^{2}$ home?
3. What is the mathematical formula for the volume of an object that covers a specific area and has uniform height(use V,h,A)? Prove your formula dimensionally correct using SI units.
4. The equation for the period of a pendulum is, $\mathrm{T}=2 \pi(1 / \mathrm{g})^{5}$. Show this is dimensionally correct.
5. Using dimensional analysis show equation is correct or incorrect.

$$
\begin{aligned}
& 1 / 2 \mathrm{mv}^{2}=1 / 2 \mathrm{mv}_{\mathrm{o}}^{2}+(\mathrm{mgh})^{-5} \\
& \mathrm{v}=\mathrm{v}_{\mathrm{o}}+\mathrm{at}^{2} \\
& \mathrm{ma}=\mathrm{v}^{2}
\end{aligned}
$$

6. How many significant figures in each of the following:

$$
\begin{array}{lllll}
78.9+/-.2 & 3.788 \times 10^{9} & 3200 & .00320 & 2.46 \times 10^{-6}
\end{array}
$$

7. Mr. L caught two king salmon in Canada this summer, one was 93.46 cm and the other was 1.303 m , both were delicious. What was the total length? How much longer was the second?
8. What is the volume of 1.00 qt in $\mathrm{cm}^{3}$ ?
9. What is the distance of a fly from the bottom left corner of a wall if it is 1.0 m high and 2.0 m to the right? What is the polar coordinate?
10. A right triangle has a hypotenuse of 3.00 m and angle of $30.0^{\circ}$. What are the lengths of the other two sides?
11. Oleic acid is a non-polar molecule. When placed on water it forms a layer one molecule thick. If you place lycopodium powder on the water and gently place a drop of acid gently in the center a ring will form. The density of oleic acid is $0.8935 \mathrm{~g} / \mathrm{cm} 3$. Find the height of one molecule. Use the apparatus provided.
